(57) **ABSTRACT**

A fiber optic enclosure includes a housing and a cable spool assembly disposed on an exterior surface of the housing. The cable spool assembly has a first tear-away end and a second tear-away end. The first and second tear-away ends include at least one area of weakness extending from an inner diameter of the cable spool assembly to an outer diameter of the cable spool assembly. A mounting plate is rotationally engaged with the cable spool assembly such that the cable spool assembly and the housing selectively and unitarily rotate about an axis of the mounting plate.

**FIBER OPTIC ENCLOSURE WITH  
TEAR-AWAY SPOOL****CROSS-REFERENCE TO RELATED  
APPLICATION**

This application is a continuation of application Ser. No. 13/924,177, filed Jun. 21, 2013, now U.S. Pat. No. 8,774,588, which is a continuation of application Ser. No. 13/554,607, filed Jul. 20, 2012, now U.S. Pat. No. 8,494,334, which is a continuation of application Ser. No. 12/973,154, filed Dec. 20, 2010, now U.S. Pat. No. 8,229,267, which is a continuation of application Ser. No. 12/199,923, filed Aug. 28, 2008, now U.S. Pat. No. 7,869,682, which claims the benefit of provisional application Ser. No. 60/970,185, filed Sep. 5, 2007, which applications are incorporated herein by reference in their entirety.

**TECHNICAL FIELD**

The present disclosure relates to fiber optic enclosures, and more particularly, to fiber optic enclosures with cable payout.

**BACKGROUND**

As demand for telecommunications increases, fiber optic networks are being extended in more and more areas. In facilities such as multiple dwelling units, apartments, condominiums, businesses, etc., fiber optic enclosures are used to provide a subscriber access point to the fiber optic network. These fiber optic enclosures are connected to the fiber optic network through subscriber cables connected to a network hub. However, the length of subscriber cable needed between the fiber optic enclosure and the network hub varies depending upon the location of the fiber optic enclosure with respect to the network hub. As a result, there is a need for a fiber optic enclosure that can effectively manage varying lengths of subscriber cable.

**SUMMARY**

An aspect of the present disclosure relates to a fiber optic enclosure for enclosing fiber optic connections. The fiber optic enclosure includes a housing and a cable spool assembly disposed on an exterior surface of the housing. The cable spool assembly has a first tear-away end and a second tear-away end. The first and second tear-away ends include at least one area of weakness extending from an inner diameter of the cable spool assembly to an outer diameter of the cable spool assembly. A mounting plate is rotationally engaged with the cable spool assembly such that the cable spool assembly and the housing selectively and unitarily rotate about an axis of the mounting plate.

Another aspect of the present disclosure relates to a method of paying out a subscriber cable from a fiber optic enclosure. The method includes rotating a housing and a cable spool assembly, which includes a subscriber cable coiled around a drum portion of the cable spool assembly, about an axis of a mounting plate of the fiber optic enclosure until a desired length of subscriber cable is paid out. A tear-away end of the cable spool assembly is split at an area of weakness. The tear-away end of the cable spool assembly is removed from the cable spool assembly.

A variety of additional aspects will be set forth in the description that follows. These aspects can relate to individual features and to combinations of features. It is to be understood that both the foregoing general description and

2

the following detailed description are exemplary and explanatory only and are not restrictive of the broad concepts upon which the embodiments disclosed herein are based.

**DESCRIPTION OF THE DRAWINGS**

FIG. 1 is a schematic representation of a fiber optic network that includes a fiber optic enclosure having features that are examples of aspects in accordance with the principles of the present disclosure.

FIG. 2 is an isometric view of the fiber optic enclosure shown schematically in FIG. 1.

FIG. 3 is an exploded isometric view of the fiber optic enclosure of FIG. 2.

FIG. 4 front view of the fiber optic enclosure of FIG. 2 with a cover removed.

FIG. 5 is an isometric view of a tear-away end of a cable spool assembly of the fiber optic enclosure of FIG. 2.

FIG. 6 is a front view of the tear-away end of FIG. 5.

FIG. 7 is an exploded isometric view of the fiber optic enclosure of FIG. 2 with a bracket.

FIG. 8 is an isometric view of the fiber optic enclosure of FIG. 7.

FIG. 9 is an alternate embodiment of a cable spool assembly having features that are examples of aspects in accordance with the principles of the present disclosure.

FIG. 10 is a front view of the cable spool assembly of FIG. 9.

FIG. 11 is an isometric view of a spindle assembly suitable for use with the cable spool assembly of FIG. 9.

FIG. 12 is an enlarged, fragmentary, isometric view of the spindle assembly of FIG. 11.

FIG. 13 is an exploded isometric view of the cable spool assembly of FIG. 9 and the spindle assembly of FIG. 11.

**DETAILED DESCRIPTION**

Reference will now be made in detail to the exemplary aspects of the present disclosure that are illustrated in the accompanying drawings. Wherever possible, the same reference numbers will be used throughout the drawings to refer to the same or like structure.

Referring now to FIG. 1, a schematic representation of a fiber optic network, generally designated 11, in a facility 13 (e.g. individual residence, apartment, condominium, business, etc.) is shown. The fiber optic network 11 includes a feeder cable 15 from a central office (not shown). The feeder cable 15 enters a feeder cable input location 17 (e.g., a fiber distribution hub, a network interface device, etc.) having one or more optical splitters (e.g., 1-to-8 splitters, 1-to-16 splitters, or 1-to-32 splitters) that generate a number of individual fibers. In the subject embodiment, and by way of example only, the fiber distribution hub 17 is located on a lower level 19 of the facility 13. Each unit in the facility 13 includes a fiber optic enclosure, generally designated 21, with a subscriber cable 22 extending from each of the fiber optic enclosures 21 to the fiber distribution hub 17. The subscriber cable 22 extending between the fiber distribution hub 17 and the fiber optic enclosure 21 typically includes multiple optical fibers.

Referring now to FIGS. 2 and 3, the fiber optic enclosure 21 will now be described. The fiber optic enclosure 21 includes a housing, generally designated 23 a cable spool assembly, generally designated 25, and a mounting plate 27 (shown in FIG. 3).

Referring now to FIG. 4, the housing 23 includes a cover 29 (shown in FIGS. 2 and 3), a base 31, a first sidewall 33, and an

3

oppositely disposed second sidewall 35. The first and second sidewalls 33, 35 extend outwardly from the base 31 such that the base 31 and the first and second sidewalls 33, 35 cooperatively define an interior region 37.

A termination module, generally designated 39, is disposed in the interior region 37 of the housing 23. The termination module 39 of the fiber optic enclosure 21 serves as the dividing line between the incoming fibers and the outgoing fibers. In the subject embodiment, the termination module 39 is mounted to the base 31 of the housing 23.

In the subject embodiment, the termination module 39 includes a plurality of sliding adapter modules 41 having front sides 43 and back sides 45. Similar sliding adapter modules 41 have been described in detail in commonly owned U.S. Pat. Nos. 5,497,444; 5,717,810, 6,591,051 and U.S. Pat. Pub. No. 2007/0025675, the disclosures of which are incorporated herein by reference.

In the subject embodiment, the interior region 37 of the housing 23 includes a slack storage area 47 in which are disposed cable management tabs 49. The cable management tabs 49 are disposed in the interior region 37 of the housing 23 to provide organization of the incoming and outgoing cable within the interior region 37 and to avoid attenuation damage to the optical fibers during storage.

The interior region 37 includes a passage 51 that extends through the base 31 of the housing 23. The passage 51 allows the connectorized ends of the subscriber cable 22 to pass into the housing 23. As incoming optical fibers pass through the passage 51, the incoming optical fibers are routed to the slack storage area 47. Connectorized ends of the incoming optical fibers are then routed from the slack storage area 47 to the front sides 43 of the sliding adapter modules 41. Connectorized ends of outgoing optical fibers are routed from the back sides 45 of the sliding adapter modules 41 and through fiber exit ports 53 which are disposed in the first and second sidewalls 33, 35.

Referring now to FIG. 3, the cable spool assembly 25 is disposed on an exterior surface of the housing 23. In the subject embodiment, the cable spool assembly 25 is disposed on the back side of the base 31, although it will be understood that the scope of the present disclosure is not limited to the cable spool assembly 25 being disposed on the back side of the base 31. The cable spool assembly 25 includes a first tear-away end 55a, an oppositely disposed second tear-away end 55b, and a drum plate assembly, generally designated 59.

The drum plate assembly 59 includes a plate portion 61, a drum portion 63, and a mounting bracket 65. In the subject embodiment, the plate portion 61 includes a generally planar surface 67 having a perimeter that is generally rectangular in shape. It will be understood, however, that the scope of the present disclosure is not limited to the plate portion 61 having a generally planar surface 67 that is generally rectangular in shape.

The drum portion 63 extends outwardly from the planar surface 67 of the plate portion 61 in a generally perpendicular direction. In the subject embodiment, the drum portion 63 extends outwardly from a center portion 69 of the plate portion 61, although it will be understood that the scope of the present disclosure is not limited to the drum portion 63 extending outwardly from the center portion 69 of the plate portion 61. The drum portion 63 is generally cylindrical in shape having an internal bore 71 and an outer surface 73. The internal bore 71 extends through the drum portion 63 and defines a central axis 74 of the drum plate assembly 59.

In the subject embodiment, the mounting bracket 65 is rigidly engaged to the plate portion 61 of the drum plate assembly 59 by a plurality of fasteners (e.g., bolts, screws,

4

rivets, etc.), which extend through a plurality of mounting holes 75 in the plate portion 61 and through a plurality of mounting apertures, which are aligned with the mounting holes 75, in the mounting bracket 65. When mounted to the plate portion 61, the mounting bracket 65 extends outwardly from the planar surface 67 of the plate portion 61 in a generally perpendicular direction such that the mounting bracket 65 extends through the internal bore 71 of the drum portion 63.

The mounting bracket 65 includes a mounting face 76 having a plurality of holes 77 for rigid engagement to the housing 23. In one embodiment, the holes 77 are thru-holes for fasteners such as rivets or bolts. In another embodiment, the holes 77 are threaded holes for threaded fasteners such as screws. In the subject embodiment, the mounting face 76 of the mounting bracket 65 extends slightly farther outwardly than an end surface 79 of the drum portion 63.

The plate portion 61 of the drum plate assembly 59 is connectedly engaged to the mounting plate 27 through a bearing, such as a lazy-susan bearing or a ball bearing. A central axis of the bearing is aligned with the center axis 74 of the drum portion 63 of the drum plate assembly 59. The bearing allows the drum plate assembly 59 to rotate about the central axis of the bearing, which is aligned with the center axis 74 of the internal bore 71, and the mounting plate 27 when the mounting plate 27 is fixed to a structure such as a wall.

Referring now to FIGS. 3, 5 and 6, the first and second tear-away ends 55a, 55b of the cable spool assembly 25 will be described. In the subject embodiment, the first and second tear-away ends 55a, 55b are generally similar in structure. Therefore, for ease of description, the first and second tear-away ends 55a, 55b will be commonly referred to as "the tear-away end 55". It will be understood, however, that the scope of the present disclosure is not limited to the first and second tear-away ends 55a, 55b being similar.

The tear-away end 55 is generally circular in shape and includes an outside diameter 81 and an inner diameter 83. The inner diameter 83 is adapted to receive the outer surface 73 of the drum portion 63. The tear-away end 55 includes at least one area of weakness 85. In the subject embodiment, the area of weakness 85 radially extends from the inner diameter 83 of the tear-away end 55 to the outer diameter 81. In one embodiment, and by way of example only, there are four areas of weakness 85 disposed on the tear-away end 55 that radially extend from the inner diameter 83 to the outer diameter 81. The four areas of weakness 85 are incrementally disposed on the tear-away end 55 so as to be 90 degrees from the adjacent area of weakness 85. In the subject embodiment, the area of weakness 85 is a perforation formed by a series of slits that extend through the tear-away end 55 with a slit disposed at the outer diameter 81 of the tear-away end 55 to serve as a point at which tearing can be initiated. In another embodiment, the area of weakness 85 is an area of reduced thickness.

In the subject embodiment, the tear-away end 55 is manufactured from a plastic material such as acrylonitrile butadiene styrene (ABS) having a thickness of 0.09 inches. It will be understood, however, that the scope of the present disclosure is not limited to the tear-away end 55 being made from ABS or to the tear-away end 55 having a thickness of 0.09 inches as the tear-away end 55 could be made from other materials including but not limited to cardboard of various thicknesses. In the embodiment in which the area of weakness 85 is an area of reduced thickness, the thickness of the area of weakness 85 is less than one-half of the thickness of the tear-away end 55. In another embodiment, the thickness of the area of weakness 85 is less than one-third of the thickness of the tear-away end

5

55. In yet another embodiment, the thickness of the area of weakness 85 is less than one-quarter ( $\frac{1}{4}$ ) of the thickness of the tear-away end 55. In one embodiment, the thickness of the area of weakness 85 is about 0.015 inches. In the embodiments in which the area of weakness is an area of reduced thickness, a slit is disposed at the outer diameter 81 of the tear-away end 55 to serve as a point at which tearing can be initiated.

The first and second tear-away ends 55a, 55b are oppositely disposed on the outer surface 73 of the drum portion 63. In the subject embodiment, the first and second tear-away ends 55a, 55b are in close fit engagement with the outer surface 73 such that the first and second tear-away ends 55a, 55b may rotate slightly. In one embodiment, the first and second tear-away ends 55a, 55b are in tight fit engagement with the outer surface 73 of the drum portion 63. The first and second tear-away ends 55a, 55b are oriented along the drum portion 63 such that a portion of the outer surface 73 of the drum portion 63 is disposed between the first and second tear-away ends 55a, 55b so that a length of the subscriber cable 22, having multiple optical fibers, can be coiled around the portion of the outer surface 73 between the first and second tear-away ends 55a, 55b. In order to protect the subscriber cable 22 from attenuation resulting from coiling of the subscriber cable 22 around the drum portion 63, the outer surface 73 has a radius that is greater than the minimum bend radius of the subscriber cable 22.

The subscriber cable 22 includes a first end and a second end. The first end of the subscriber cable 22 has connectorized ends, which are inserted through the passage 51 and connectedly engaged with the front sides 43 of the sliding adapter modules 41. The second end of the subscriber cable 22 is configured for connectivity with the fiber distribution hub 17. However, as shown in FIG. 1, the length of subscriber cable 22 needed between each of the fiber optic enclosures 21 in the facility 13 and the fiber distribution hub 17 will vary depending upon the location of each fiber optic enclosure 21 with respect to the fiber distribution hub 17.

A method of installing and using the fiber optic enclosure 21 to account for the varying lengths of subscriber cable 22 needed between the fiber optic enclosure 21 and the fiber distribution hub 17 will now be described. The fiber optic enclosure 21 provides dual functionality by serving as a storage location for the subscriber cable 22 and by selectively paying out a desired length of the subscriber cable 22. A given length of subscriber cable 22 is stored in the fiber optic enclosure 21 by coiling the length of subscriber cable 22 around the cable spool assembly 25. In one embodiment, the length of subscriber cable 22, which is coiled around the cable spool assembly 25, is in the range of 100 to 500 feet. In another embodiment, the length of subscriber cable 22 coiled around the cable spool assembly 25 is 300 feet. With the cable spool assembly 25 disposed on the exterior surface of the housing 23, the fiber optic enclosure 21 with the cable spool assembly 25 can provide more effective cable management for a greater length of subscriber cable 22 than a fiber optic enclosure 21 without the cable spool assembly 25.

The second function of the fiber optic enclosure 21 involves the selective payout of the subscriber cable 22. As previously mentioned, the first end of the subscriber cable 22 is in connected engagement with the termination module 39, which is disposed in the interior region 37 of the housing 23. With the first end of the subscriber cable 22 in connected engagement with the front sides 43 of the sliding adapter modules 41 and the outgoing optical fibers disengaged from the back sides 45 of the sliding adapter modules 41, the subscriber cable 22 can be paid out. As the cable spool assembly

6

bly 25 is rigidly engaged with the housing 23 through the mounting face 76 of the mounting bracket 65 and rotationally engaged with the mounting plate 27 through the bearing disposed between the mounting plate 27 and the plate portion 61 of the drum plate assembly 59 of the cable spool assembly 25, the cable spool assembly 25 and housing 23 can selectively rotate about the central axis of the bearing, which is aligned with the center axis 74 of the internal bore 71 of the drum portion. Therefore, with the cable spool assembly 25 rigidly mounted to the housing 23 and rotationally mounted to the mounting plate 27, which is mounted to a wall, the desired length of the subscriber cable 22 can be paid out from the fiber optic enclosure 21 by rotating the fiber optic enclosure 21 in a rotational direction about the center axis 74. Since the housing 23 and the cable spool assembly 25 rotate unitarily about the central axis 74, the second end of the subscriber cable 22 can be paid out without the first end of the subscriber cable 22 being pulled out of the termination module 39.

Once the desired length of subscriber cable 22 has been paid out, the rotation of the fiber optic enclosure 21 is ceased. At this point, the tear-away ends 55 of the cable spool assembly 25 can be removed. To remove the tear-away ends 55 of the cable spool assembly 25, the area of weakness 85 that extends from the inner diameter 83 to the outer diameter 81 is split. In the subject embodiment, the area of weakness 85 can be split by breaking, tearing, cutting, ripping, etc. The area of weakness 85 is split along the length of the area of weakness 85. When the split reaches the inner diameter 83 of the tear-away ends 55, the opening created by splitting the area of weakness 85 can be expanded so that the tear-away ends 55 can be removed from the cable spool assembly 25. In another embodiment, other areas of weakness 85 can be split to create an opening between the areas of weakness 85, through which the drum portion 63 of the cable spool assembly 25 can be passed.

Referring now to FIGS. 7 and 8, with the tear-away ends 55 of the cable spool assembly 25 removed, the position of the fiber optic enclosure 21 can be fixed such that it does not rotate relative to the mounting plate 27. A first bracket, generally designated 87a, and a second bracket, generally designated 87b, can be used to secure the position of the fiber optic enclosure 21 after the rotation of the fiber optic enclosure 21 has ceased. In the subject embodiment, the first and second brackets 87a, 87b are generally similar in structure. Therefore, for ease of description, the first and second brackets 87a, 87b will be commonly referred to as "the bracket 87". It will be understood, however, that the scope of the present disclosure is not limited to the first and second brackets 87a, 87b being similar.

In the subject embodiment, the bracket 87 is U-shaped having a front plate 89, a left plate 91, and a right plate 93. It will be understood, however, that the scope of the present disclosure is not limited to the bracket 87 being U-shaped. In the subject embodiment, a mounting tab 95 extends in a generally perpendicular direction to the front plate 89. The mounting tab 95 includes a thru-hole 97 for mounting the bracket 87 to a wall. In the subject embodiment, the left and right plates 91, 93 include mounting openings 99 for mounting the left and right plates 91, 93 to the housing 23. As the bracket 87 is mounted to the wall or other structure and extends between the mounting plate 27 and the housing 23, the housing 23 is no longer able to selectively rotate relative to the mounting plate 27 since it is restricted by the engagement with the bracket 87.

In order to prevent rotation of the housing 23 relative to the mounting plate 27 and to protect the subscriber cable 22

stored on the drum portion **63** of the cable assembly **25** from environmental damage, the first and second brackets **87a**, **87b** are installed on the opposite sides of the housing **23** such that the left and right plates **91**, **93** of the first bracket **87a** and the left and right plates **91**, **93** of the second bracket **87b** each extend about half of the depth **D** (shown in FIG. **8**) of the housing **23**.

The areas of weakness **85** may be advantageous for making a more compact fiber optic enclosure **21** after the fiber optic enclosure **21** has been mounted to a wall or structure and after the subscriber cable **22** has been paid out from the fiber optic enclosure **21**. While the cable spool assembly **25** provides for storage of the subscriber cable **22** during shipping and handling and cable management during pay out of the subscriber cable **22**, the outer diameter **81** of the cable spool assembly **25** may not be required after the subscriber cable **22** is paid out. The tear-away ends **55** allow for the overall size of the cable spool assembly **25** to be reduced following payout.

Referring now to FIGS. **9** and **10**, an alternate embodiment of a cable spool assembly **225** is shown. The cable spool assembly **225** includes a first tear-away end **255a** and a second tear-away end **255b**. The tear-away ends **255** are oppositely disposed on a drum portion **263**. In the subject embodiment, the tear-away ends **255** are connected (e.g., press-fit, bonded, soldered, etc.) to the drum portion **263**. The drum portion **263** is cylindrically shaped and includes an internal bore **271** and an outer surface. The internal bore **271** extends through the drum portion **263** and defines a central axis **274**.

The tear-away end **255** is generally circular in shape and includes an outside diameter **281**. The tear-away end **255** also includes at least one radial area of weakness **85**. In the subject embodiment, the area of weakness **285** radially extends from the outside diameter **281** of the tear-away end **255** to an inner diameter **301**. In the subject embodiment, at least one circular area of weakness **303** is also included in the tear-away end **255**. The circular area of weakness **303** extends around the tear-away end **255** and has a radius that is less than the radius of the outer diameter **281**. In the subject embodiment, and by way of example only, there are two radial areas of weakness **285** disposed on the tear-away end **55** that radially extend from the inner diameter **301** to the outer diameter **281** and there are two circular areas of weakness **303**, with one of the two circular areas of weakness being disposed at the inner diameter **301**. In the subject embodiment, the two radial areas of weakness **285** are disposed so as to be 180 degrees apart while the two circular areas of weakness **303** are concentric. In the subject embodiment, the radial and circular areas of weakness **285**, **301** are areas of reduced thickness.

The first tear-away end **255a** includes a plurality of apertures **305**. The apertures **305** are disposed in the first tear-away end **255a** for rigidly engaging the cable spool assembly **225** to the back side of the base **31** of the housing **23**. The apertures **305** would align with holes in the base **31** of the housing **23** and would allow the first tear-away end **255a** to be fastened to the housing **23** with fasteners such as screws, bolts, rivets, etc.

Referring now to FIGS. **11** and **12**, a spindle assembly, generally designated **307**, will be described. The spindle assembly **307** includes a mounting plate **309** having a plurality of mounting thru-holes **311** for fastenedly engaging the mounting plate **309** to a wall or structure. The spindle assembly **307** also includes a spindle, generally designated **313**, having a bore **315** with an axis **317**. In the subject embodiment, the spindle is connected (e.g., fastened, bonded, soldered, etc.) to the mounting plate **309**.

The spindle **313** also includes a plurality of resilient latches, generally designated **319**. The resilient latches **319**

extend outwardly from the mounting plate **309**. The resilient latches **319** include a free end **321** and a latch portion, generally designated **323**. The latch portion **323** includes an end surface **325** and a radially outwardly facing lip **327**. The lip **327** extends outwardly in a direction that is generally perpendicular to the axis **317**. A chamfered edge **329** is disposed between the end surface **325** and the lip **327**.

Referring now to FIGS. **9-13**, the internal bore **271** of the drum portion **263** of the cable spool assembly **225** is adapted for receiving the spindle **313**. In the subject embodiment, the internal bore **271** and the drum portion **263** are in snap fit engagement with the spindle **313**. With the spindle assembly **307** mounted to a wall or structure, the central axis **274** of the internal bore **271** of the cable spool assembly **225** is aligned with the axis **317** of the bore **315** of the spindle **313**. The cable spool assembly **225** is then pressed onto the spindle **313** such that contact between the cable spool assembly **225** and the chamfered edge **329** of the spindle **313** causes the resilient latches **319** to flex toward the axis **317** until the internal bore **271** of the drum portion **263** fits around the spindle **313**. When the cable spool assembly **225** is fully engaged on the spindle **313**, the resilient latches **319** spring back thereby engaging an edge **331** of the drum portion **263** with the lip **327** of each of the resilient latches **319** of the spindle **313**. With the spindle **313** engaged with cable spool assembly **225**, the cable spool assembly **225** and the housing **23** can selectively slidingly rotate about the spindle **313** of the spindle assembly **307**, which is rigidly mounted to the wall or structure.

The circular area of weakness **301** may be advantageous as it allows for the tear-away ends **255** of the cable spool assemblies **225** to be scalable. If the fiber optic enclosure **21** is requested with a less amount of subscriber cable **22**, the outer diameter **281** of the cable spool assembly **225** can be adjusted by tearing off part of the tear-away ends **255** at the circular area of weakness **301**.

In addition, the circular area of weakness **301** may be advantageous as it allows for only one part number to be cataloged. In a scenario where cable spool assemblies **225** having different outer diameters **281** are required, a cable spool assembly **225** having a first outer diameter **281** can be modified to a cable spool assembly **225** having a second outer diameter **281** by tearing off part of the tear-away ends **255** at the circular area of weakness **301**.

Various modifications and alterations of this disclosure will become apparent to those skilled in the art without departing from the scope and spirit of this disclosure, and it should be understood that the inventive scope of this disclosure is not to be unduly limited to the illustrative embodiments set forth herein.

What is claimed is:

1. An enclosure comprising:

a housing;

a drum disposed at an exterior of the housing, the drum being rotationally fixed relative to the housing, the drum extending away from the housing to a distal end;

a cable wrapped around the drum; and

a flange extending radially outwardly from the distal end of the drum to aid in retaining the cable on the drum, at least a portion of the flange being removable from the drum to reduce an overall size of the enclosure after at least a portion of the cable is paid out.

2. The enclosure of claim 1, wherein the flange is fully removed from the drum after the at least a portion of the cable is paid out.

3. The enclosure of claim 1, further comprising a second flange extending radially outwardly from the drum at a location between the distal end and the housing.

9

4. The enclosure of claim 3, wherein at least a portion of the second flange is removable from the drum after the at least a portion of the cable is paid out.

5. The enclosure of claim 4, wherein the second flange is fully removed from the drum after the at least a portion of the cable is paid out.

6. The enclosure of claim 1, further comprising a mounting plate that is configured to be attached to a surface, wherein the drum is rotationally connected to the mounting plate.

7. The enclosure of claim 1, wherein the flange includes an area of weakness that facilitates removing the flange from the drum.

8. The enclosure of claim 7, wherein at least part of the area of weakness extends radially along the flange.

9. The enclosure of claim 7, wherein at least part of the area of weakness extends circumferentially along the flange.

10. A method of dispensing a cable comprising:  
providing an enclosure including a drum extending outwardly from a housing and a radial flange extending

10

radially outwardly from the drum, the enclosure having an outer footprint defined by the flange;  
pulling an end of a cable that is wrapped around the drum, thereby unwinding at least part of the cable from the drum; and

removing the radial flange from the drum so that the outer footprint of the enclosure is defined by the housing.

11. The method of claim 10, wherein pulling the end of the cable causes the housing and drum to rotate in unison about a mounting plate to which the drum is mounted.

12. The method of claim 11, further comprising securing a bracket arrangement to the enclosure to rotationally lock the housing and drum relative to the mounting plate.

13. The method of claim 12, wherein securing the bracket arrangement to the enclosure covers the drum and any cable remaining on the drum.

14. The method of claim 12, wherein securing the bracket arrangement includes securing a first U-shaped bracket and a second U-shaped bracket to the enclosure.
